WORMS, BELGIAN
WORMS, BELGIAN REDS,
MINIS, AND REDS

REFRIGERATION
OPTIONAL

GREAT FOR FROGS
AND TURTLES

CHEMICAL-FREE; SAFE
FOR FEEDING PETS

BIG RED WORMS

EISENIA HORTENSIS

USED TO CATCH

Panfish, trout, and most freshwater fish will eat these worms.

ABOUT

- Extremely easy to care for
- Can be used in any environment:
 - Ice fishing
 - Brackish waters
 - Fresh water
- Attract fish due to their lively movement
- Can also be used for composting

DIRECTIONS

- Store at temperatures from 35-70° F. Big red worms are very easy to keep alive, and will keep for weeks at room temperature in our DMF Bait Co. cups. In bulk, they will last about a month – and much longer, if refrigerated.
- Must be kept in a ventilated container. Remove the ice pack and refreeze it for further use. If the ice pack is broken, throw it away and change the worm bedding immediately. Worms will eat through any biodegradable packaging over time unless they are refrigerated.
- We strongly recommend you change the bedding by the end of the third week and at least once a month afterwards. There are numerous types of bedding materials available at your local sporting goods store – you do not have to use dirt bedding. Paper and cardboard bedding is fine.
- Worms do not require feed. All beddings have feed in them. Worms will live for months if refrigerated and cared for properly.
